

Streamlining the Last-Mile of Cyber Hygiene

The Problem

While security teams invest in EDRs, firewalls, and vulnerability scanners, configuration errors and policy misalignments still

leave organizations vulnerable to breaches, ransomware, and compliance failures. These security gaps - overlooked by traditional tools - constitute "last-mile" failures that silently erode your posture.

The Remedio Solution

Remedio is a configuration-focused security platform that detects, fixes, and prevents the most common and most easily exploited attack paths lurking in your endpoints, servers, and Active Directory - without negatively impacting users or productivity.

The Workflow

Discover

Instantly uncover configuration risks, policy violations, and persistent exposure across Windows, macOS, and Linux machines - both physical and virtual.

Validate

Assess posture, verifying enforcement, closing gaps, and correlating current states to compliance requirements (e.g., NIST, HIPAA, ISO 27001).

Fix

Safely remediate, enforce & auto-reapply policies, and enact hardening recommendations with a click. No reboots. No performance hits. No downtime.

Prevent

Ensure continuous configuration hygiene, stop drift before it starts, and avoid disruptions.

The Use Cases

- Stopping ransomware at the misconfiguration layer.
- Accelerating audit-readiness for security frameworks.
- Mitigating human error in IT ops.
- Scriptless & error-proof hardening.

- **65%** faster time to compliance.
- **80%** reduction in configuration-related incidents.
- **100%** visibility into endpoint security posture.
