

Delivering the Last Mile of Enterprise Security

The Problem

Enterprises have invested heavily in tools that discover and itemize risk. But findings, scores, and tickets do not reduce exposure. Risks fall only when the underlying condition is changed, a vulnerability patched, a configuration corrected, a compliance control enforced, an unauthorized application removed, or an unsafe AI setting governed, and the outcome is verified. This is security's last-mile problem: getting risk intelligence over the line into measurable, lasting risk reduction.

The Remedio Solution

Remedio unifies configuration security, vulnerability remediation and patching, compliance, AI governance, and application control. Teams can identify exposure, take the appropriate action, and verify the outcome through one controlled workflow.

The Workflow

Discover

Identify configuration drift, missing patches, baseline deviations, unauthorized or vulnerable applications, and unmanaged AI components across Windows, macOS, and Linux machines – both physical and virtual.

Validate

Assess posture, verify enforcement, close gaps, and correlate current states to compliance requirements such as NIST, HIPAA, ISO 27001.

Fix

Safely remediate, enforce and auto-reapply policies, and enact hardening recommendations with a click. No reboots. No performance hits. No downtime.

Verify and Prevent

Confirm the outcome, detect recurrence or drift, and roll back when needed.

Remedio applies one continuous remediation cycle across every control domain.

The Use Cases

Reduce ransomware
exposure by closing
exploitable configuration
and vulnerability paths

Accelerate audit readiness
with evidence of the
endpoint state and
remediation outcome

**Minimize manual
Security-IT handoffs**
through one connected
remediation record

**Apply repeatable
hardening** and
configuration corrections
without scripting

Govern enterprise AI
agents, applications, MCPs,
skills, plugins, credentials,
and configurations

**Close the vulnerability-
to-patch gap** with
controlled execution and
verification

Remove unauthorized tooling
or vulnerable applications

Detect and correct policy drift
across the fleet

Outcome proof

65%

faster time to compliance

80%

reduction in configuration-
related incidents

100%

visibility into endpoint
security posture

**Fix it, don't
just find it.**
